

MINI UV SERIES

PTAC model

ADVANTAGES OF UV

As HVAC systems work to control indoor climates for comfort and optimized productivity, HVAC operation also promotes the biological contamination of indoor air. Bio-growth, particularly mold, that occurs on normally wet cooling coils and other interior surfaces, is a common problem and can be the major source of unhealthy air in any building.

Blue Shield has developed eco-smart solutions that work to reduce allergies, occurrences of the flu, colds, viruses and other health issues that arise from contaminated indoor air. At the same time, HVAC energy and maintenance costs can be reduced.
